

The two-valley Galerkin is variational-convergent — exact at (7,1); at 2° the valley lifts the plateau 4.5×, with a residual fixed-frame conditioning floor

A (7,1) valley-complete ladder → FDFD floor
(the method reaches eigenvalue-exactness)

B 2° two-valley: gcut converges per rank, but the fixed-frame basis is conditioning-limited ($+1.5e-3$)
